Track - Coordinated AI Interview Panel

Problem Statement:

Build an adaptive voice interview platform in which one or more AI interviewers represent different roles. The interview panel may include a technical interviewer, hiring manager, customer, product manager or behavioural interviewer. The system should adapt its questions based on the candidate's previous answers rather than following only a predefined question list. The solution should demonstrate Real-time and interruptible voice interviews Multiple interviewer roles or personalities Shared candidate context between interviewer roles Dynamic follow-up questions Controlled interviewer turn-taking Role-play or scenario-based questions Difficulty adjustment based on candidate performance Identification of vague or contradictory answers Evidence-based feedback linked to the interview transcript A structured final assessment Clear disclosure that the candidate is interacting with AI Example scenario A candidate provides a technically correct solution but does not explain its impact on customers. The technical interviewer may accept the implementation, while the product interviewer should challenge the candidate to explain the business implications.

Problem Description:

Interview panels exist because a tech lead, product manager, and hiring manager each catch different blind spots: code quality, customer impact, culture fit. Today's AI interview tools compress this into one scripted, single dimension bot with no context-aware follow-ups, forcing a flat, averaged score instead of real panel disagreement and nuance.

Echo Sphere

agora Proposed Solution / Idea Overview:

Huddle Panel is a live, realistic panel interview room where three specialised AI interviewers, Technical, Product, and HR will face the candidate in a virtual meeting environment, not a single scripted bot.

Each agent reasons independently over a Shared Candidate Model: continuously updated skill scores, difficulty level, and verified claims. Interviewers bid to speak based on relevance to the candidate's last answer, an AI Moderator resolves who gets the floor, enabling natural interruption instead of rigid turns. A Claims Ledger cross checks every answer against earlier ones to catch vagueness or contradiction. The session closes with a structured, evidence linked assessment that preserves genuine disagreement between panelists instead of collapsing it into one flat, averaged score.

The Multi Agent Mechanism

- **Agents bid based on answer relevance**

If the candidate talks system architecture, the Technical panelist's bid spikes. If customer impact is skipped, the Product panelist's relevance score spikes instead and challenges the candidate.

- **Difficulty adapts to candidate performance**

Adapts on the fly scales from baseline concepts up to distributed-systems bottlenecks based on how the candidate is performing in real time.

- **Full-duplex conversation**

Full-duplex conversational voice at under 700ms, with natural interruptibility from both the candidate and any panelist, no waiting for a turn.

System Architecture

Example Scenario Walkthrough

Key Features

CORE	DIFFERENTIATORS	STRETCH GOALS
• Real-time interruptible voice • Multiple interviewer personas • Shared candidate context • Dynamic follow-ups • Controlled turn-taking • Role-play scenario questions • Per-skill difficulty adjustment • Vague / contradiction detection • Evidence-linked feedback • Structured final assessment • Clear AI disclosure	• Live shared-context visualization • Bidding-based turn-taking • Claims Graph for contradictions • Preserved panel dissent in report	• Candidate-facing feedback summary • Configurable panel composition • Interview replay / scrub mode

agora User Experience - The Virtual Panel Room

Candidates face three AI panelists in a familiar video-call interface, with transparent AI disclosure, live captions, and dynamic turn-taking.

Interface Elements

- Active Speaker Cues**
Glowing border + live waveform identifies whoever currently has the floor.
- Upfront AI Disclosure**
Persistent badge clearly identifies the panel as AI before the interview begins.
- Live Captions & Phase**
Real-time captions, interview phase, and session timer keep the candidate oriented.

agora Feasibility & Technical Implementation

Proven Building Blocks — Orchestration Is the Work

- **Voice & Video Pipeline**
WebRTC / Agora RTC / LiveKit — sub-second streaming with seamless barge-in.
- **Speech Engine**
Deepgram Nova-2 for STT + Cartesia / ElevenLabs for distinct interviewer voices.
- **Intelligence & Orchestration**
Fast LLMs power panel bidding, Claims Ledger, turn-taking, and scoring.

Additional Notes:

HACKATHON 2026

- **BEYOND THE HACKATHON**

1. **From Practice to Real Hiring**

Start with mock interviews and campus placements, then expand into enterprise first-round screening and structured candidate evaluation.

2. **Built for Interview Depth**

Kyro Panel focuses on meaningful conversation, adaptive questioning, and evidence based evaluation rather than static question banks.

3. **Multi-Agent Collaboration**

Three specialized AI interviewers bring different perspectives, Technical, Product, and HR, while a shared context layer keeps the conversation coordinated.

- **OUR PHILOSOPHY**

Depth over breadth.

Build one interview experience that genuinely listens, adapts, challenges, and evaluates instead of adding features that operate in isolation.

- **FUTURE VISION**

One interview. Multiple perspectives. One evidence-backed view of the candidate.
